

*Crepidacantha carsioseta* Winston & Heimberg, 1986. Tilbrook, Hayward & Gordon, 2001, p.92, fig.16A.

Now *Crepidacantha poissonii* (Audouin, 1826); see Tilbrook, 2006: 274.

*CREPIDACANTHA CARSIOSETA* WINSTON & HEIMBERG  
(Fig. 16A)

*Crepidacantha carsioseta* Winston & Heimberg, 1986:  
27, figs 64–66.

*Crepidacantha carsioseta*: Ryland & Hayward, 1992:  
277, fig. 25d.

*Remarks*

*Crepidacantha carsioseta* differs from *C. longiseta* Canu & Bassler, 1928a in its avicularia which are frontolaterally placed and transversely orientated, thus pointing laterally, whereas those of *C. longiseta* are lateral-oral, very long, and proximally orientated. The shapes of the primary orifices are similar although the proximal border of *C. carsioseta* is far more convex than in *C. longiseta*.

This distinctive species was only recently described from Indonesia by Winston & Heimberg (1986), and subsequently reported from Heron Island by Ryland & Hayward (1992).

*Crepidacantha carsioseta* was mainly found on small pieces of coral debris from Poanangisu, Efate.
